**Q.1. Describe a process framework in your own words. When we say that framework activities are applicable to all projects, does this mean that the same work tasks are applied for all projects, regardless of size and complexity? Explain.**

- ➔ Process frameworks can be described as the lists of all key processes performed in an organisation, grouped hierarchically to show how they relate to each other. It establishes the foundation for a complete software process by identifying a small number of framework activities that are applicable to all software projects, regardless of size or complexity. In simpler words, process framework defines the business processes of an enterprise in a hierarchy.

Yes, process framework is applicable to all the projects; hence the same work tasks are applied for all projects, regardless of their size or complexity. A process framework involves heavy communication with the customer to gather requirements; this activity establishes a plan for the software engineering work that follows. Frameworks are strategies that we use to solve the problem; hence it is applied for all projects, regardless of size and complexity.
